Subject: Traffic Operational Analysis for Huntwood Avenue Road Diet Study

Dear Ms. Solla,

This brief technical memorandum summarizes Advanced Mobility Group's (AMG) traffic operational and safety analysis for the Huntwood Avenue Road Diet Study between the intersections of Huntwood Avenue/Industrial Parkway and Huntwood Avenue/Sandoval Way. As a part of the Huntwood Avenue Road Diet project, the City will be installing Class II and Class IV bike lanes along Huntwood Avenue in both directions. This will result in lane reduction in the southbound direction along Huntwood Avenue within the project study area and lane geometry reconfiguration at the study intersections.

The purpose of the operational and safety analysis is to develop short-term and long-term lane configuration and signal phasing recommendations at the two study intersections to enhance bicycle and pedestrian safety, safety of vehicles maneuvering through the intersections, optimize traffic flow, and minimize spillover of traffic queues on the railroad tracks on Huntwood Avenue, south of Sandoval Way.

Analysis

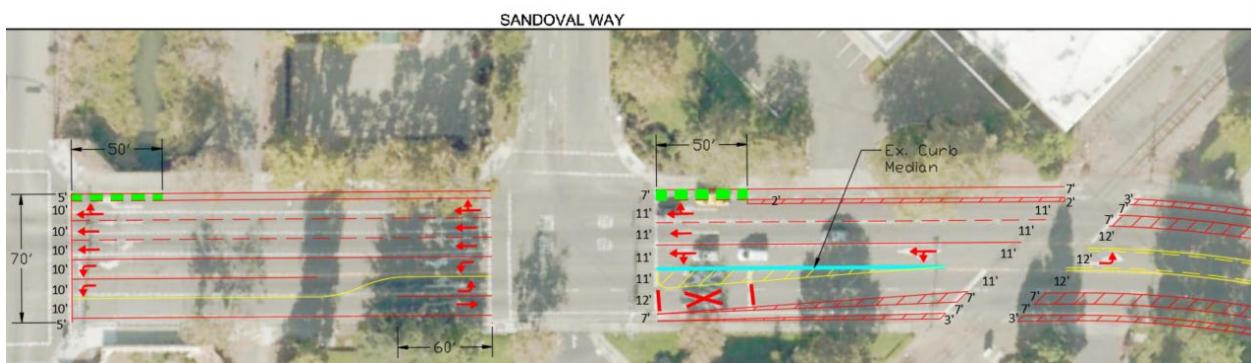

AMG developed existing conditions traffic simulation models using Synchro/SimTraffic software using existing lane configuration, traffic signal timings and traffic volumes provided by the City and available historical data. Existing conditions level of service (LOS), delay and 95th percentile queue length in feet were evaluated for the weekday a.m. and p.m. peak periods. Upon existing conditions analysis, AMG developed proposed conditions traffic simulation models to evaluate the two alternatives summarized below. The proposed lane configurations were selected for analysis, since these alternatives provides Class II and Class IV bike lanes along Huntwood Avenue.

1. Alternative 1: Lane Geometry Reconfiguration at Huntwood Avenue/Industrial Parkway and Huntwood Avenue/Sandoval Way

Alternative 1 is a short-term alternative which can be implemented with limited funding and minor modifications to existing roadway infrastructure and traffic signal equipment. Alternative 1 reconfigures existing northbound Huntwood Avenue approach at the intersection of Huntwood Avenue/Industrial Parkway and southbound approach at the intersection of Huntwood Avenue/Sandoval Way. Under existing conditions, the northbound approach at Huntwood Avenue/Industrial Parkway provides an exclusive left-turn lane, a shared through and left-turn lane, a through lane and an exclusive right-turn lane. The proposed lane configuration converts the existing northbound approach to two exclusive left-turn lanes, two through lanes and a shared through and right-turn lane.

Under existing conditions, the southbound approach at Huntwood Avenue/Sandoval Way provides a shared through and left-turn lane and a shared through and right-turn lane. The proposed lane configuration reduces the number of through lanes from two through lanes to one and provides an exclusive left-turn pocket and a shared through and right-turn lane. No lane geometry changes are recommended at the remaining approaches at Huntwood Avenue/Industrial Parkway and Huntwood Avenue/Sandoval Way. AMG developed signal timing recommendations with existing signal phasing to improve traffic flow and reduce spillover on the railroad tracks on Huntwood Avenue, south of Sandoval Way. **Figure 1** illustrates the proposed lane configuration.

Figure 1: Alternative 1 Proposed Lane Configuration

2. Alternative 2: Lane Geometry and Signal Phasing Modification at Huntwood Avenue/Industrial Parkway and Huntwood Avenue/Sandoval Way

Alternative 2 is a long-term alternative which reconfigures the northbound and southbound approaches at the study intersections. The proposed lane configuration under Alternative 2 provides the same lane configuration as Alternative 1 for the northbound Huntwood Avenue approach at the intersection of Huntwood Avenue/Industrial Parkway and southbound approach at the intersection of Huntwood Avenue/Sandoval Way. Additionally, the northbound approach at Huntwood Avenue/Sandoval Way is reconfigured from existing shared through and left-turn lane, through lane and a shared through and right-turn lane to an exclusive left-turn lane, two through lanes and a shared through and right-turn lane.

Currently, the intersection of Huntwood Avenue/Industrial Parkway operates with protected left-turn phasing along Industrial Parkway and split phasing along Huntwood Avenue. With the proposed lane configuration, it is recommended to convert the split phasing along Huntwood Avenue to protected left turn phasing. This allows the intersection to operate as an eight-phase signal permitting non-conflicting movements to be served simultaneously.

Under existing conditions, the intersection of Huntwood Avenue/Sandoval Way operates with split phasing for all four approaches. With the proposed lane configuration, AMG recommends converting Huntwood Avenue approaches to protected-permissive left-turn phasing and Sandoval Way and Driveway approaches to permissive phasing. This allows the intersection to operate as a six-phase signal permitting non-conflicting movements to be served simultaneously. **Figure 2** illustrates the proposed lane configuration.

Figure 2: Alternative 2 Proposed Lane Configuration

Tables 1 and **2** summarize the results of our preliminary analysis. **Appendix A** contains Synchro and SimTraffic analysis reports.

Based on the results of the preliminary analysis conducted, Alternative 2 proposed lane configuration and AMG's recommended signal phasing and timing changes reduces the delay experienced at Huntwood Avenue/Sandoval Way considerably during both a.m. and p.m. peak periods. Additionally, it is expected to facilitate reduction in traffic queue spillovers on the railroad track, south of Sandoval Way.

Table 1: LOS & Delay Comparison

#	Intersection	Peak Period	Synchro						SimTraffic					
			Existing Conditions		Alternative 1		Alternative 2		Existing Conditions		Alternative 1		Alternative 2	
			Average Delay (sec)	LOS

2	Hundwood Avenue/Sandoval Way	AM	95	741	160	1211	39	110	134	277	225	277	139	154
		PM	406	154	328	488	151	74	384	140	308	237	228	33

Notes:

Bold represents traffic queue spillover at upstream intersection.

Storage length between Huntwood Avenue/Industrial Parkway and Huntwood Avenue/Sandoval Way is approximately 240 feet. Storage Length between Huntwood Avenue/Sandoval Way and railroad tracks is approximately 185 feet.

SimTraffic results were based on an average of five simulation runs.

Additionally, AMG conducted denied vehicle analysis using SimTraffic which estimates the number of vehicles denied entry into the network due to capacity or operational constraints. Table 3 summarizes the results of the analysis. Based on the analysis conducted, Alternative 2 significantly reduces the number of denied vehicles in the system compared to existing conditions and Alternative 1. this is especially critical given the southbound approach lane reduction, south of Huntwood Avenue/Industrial Parkway.

Table 3: Denied Vehicles in the Network

Peak Period	SimTraffic		
	Existing Conditions	Alternative 1	Alternative 2
AM	464	521	312
PM	739	773	407

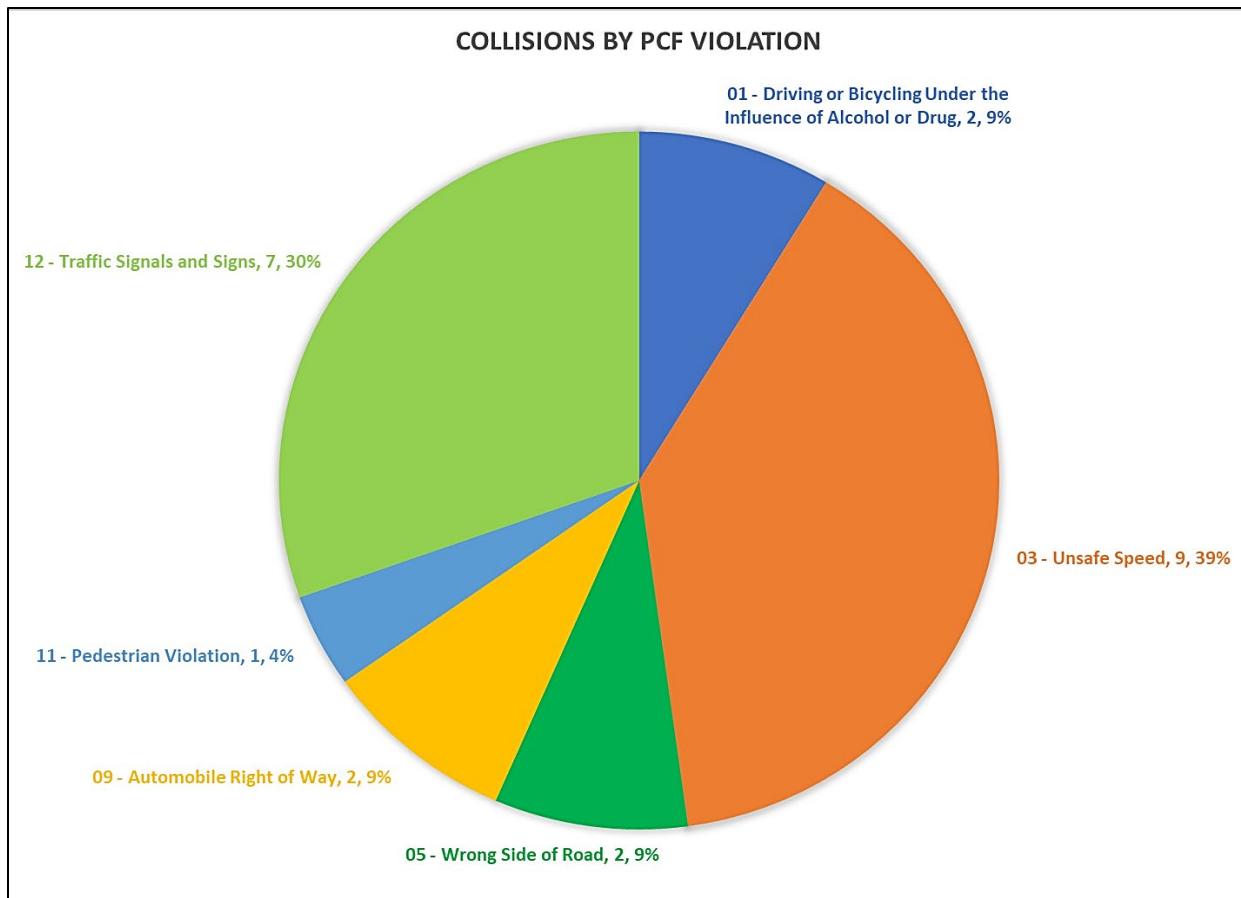

Note:

SimTraffic results were based on an average of five simulation runs.

Collision Analysis

AMG conducted collision analysis at the two study intersections from January 2015 to December 2019 using the Transportation Injury Mapping System (TIMS) collision database. During the five-year period, there were 23 collisions at the study intersections with 21 collisions at Huntwood Avenue/Industrial Parkway and two collisions at Huntwood Avenue/Sandoval Way. The collisions were evaluated based on the primary collision factor (PCF) violation and type of collision. **Figure 3** illustrates collisions based on PCF violation.

Figure 3: Collisions by PCF Violation Category

Note: Data labels in Figure 3 reflect PCF Violation, Number of PCF Violation Accidents, Percentage PCF Violation.

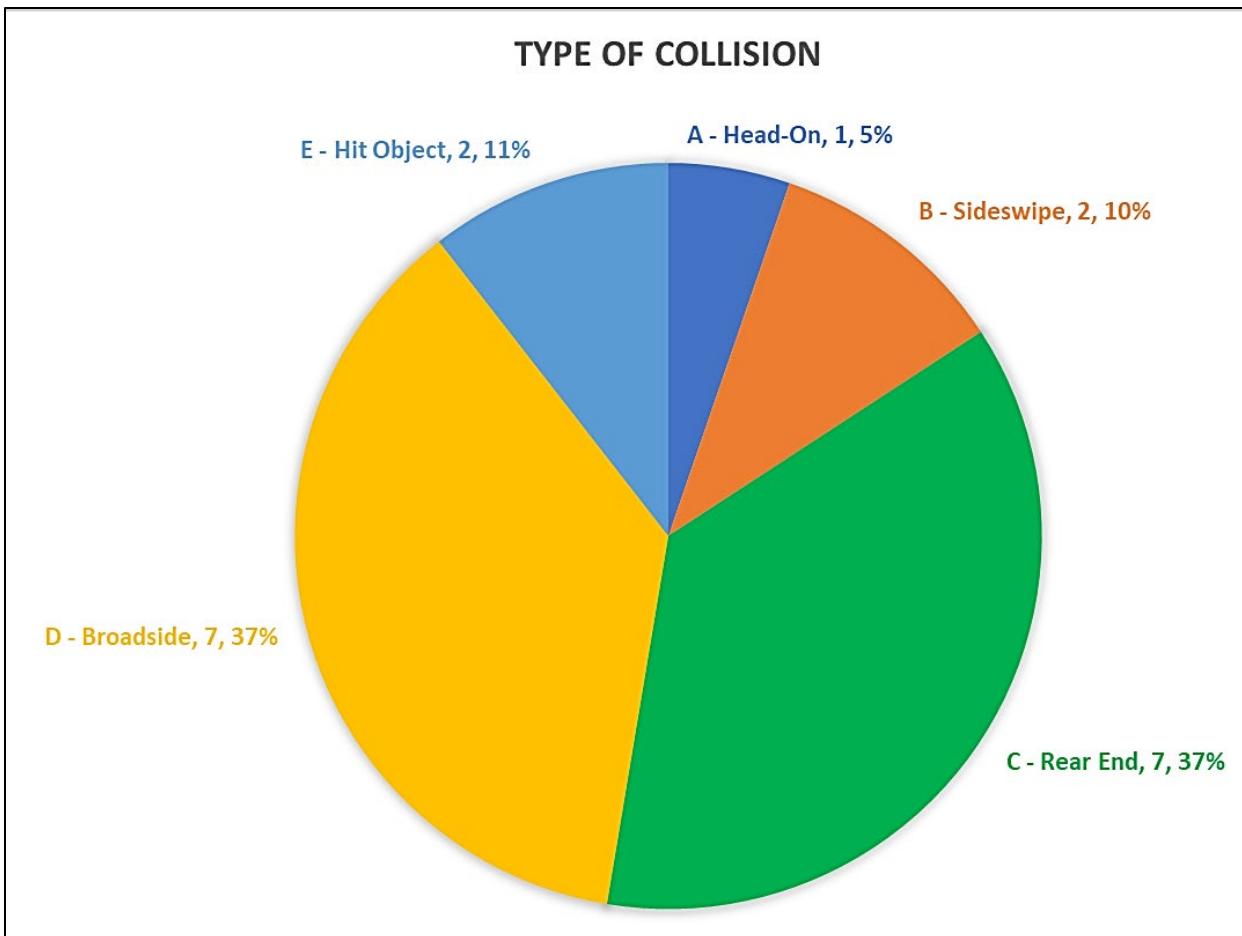

Based on the PCF violation collision analysis, majority of the collisions at the two study intersections were attributed to traffic signals and signs (30%) and unsafe speed (39%).

As mentioned above, collisions at the two study intersections were evaluated based on type of collisions as well. PCF violation categories 1 – Driving or bicycling under influence of alcohol or drug and 5 – Wrong side of the road were excluded from this analysis. **Figure 4** illustrates collisions based on type of collision.

Based on the type of collision analysis, majority of the collisions at the two study intersections were attributed to broadside (37%) and rear end (37%) collisions. Typically, broadside collisions occur

because of non-adherence of traffic signal indications, stop signs, and ignoring other traffic devices. Most rear end collisions occur because of unsafe speeding.

Figure 4: Collisions by Type of Collision

Note: Data labels in Figure 4 reflect Type of Collision, Number of Accidents, Percentage.

As discussed in previous sections, the intersection of Huntwood Avenue/Industrial Parkway operates with split phasing signal operation along Huntwood Avenue for the north and south approaches and protected left-turn phasing along Industrial Parkway for the east and west approaches. The intersection of Huntwood Avenue/Sandoval Way operates with split phasing on all four approaches. Split phase traffic signal operations often result in higher delays at the intersection. This is because split phase signal operation serves relevant phases exclusively and does not permit other non-conflicting or permissive phases to be served. As a result of the split phase signal operation and heavy through and turning traffic demands, the two study intersections experience significant traffic delays which is affirmed by field observations and existing conditions traffic analysis. Higher traffic delays often lead to driver frustration, non-adherence to traffic controls such as red lights and speeding to get through the intersection during yellow signal indications, resulting in broadside and rear end collisions.

Broadside collisions and rear end collisions are rectifiable by signal phasing modifications and reducing traffic delays at the study intersection. This can be achieved by modifying existing signal phasing as recommended in Alternative 2 which in turn will reduce traffic signal cycle lengths and delays. This improves overall safety for vehicles, pedestrians, and bicycles at the two intersections. Shorter cycle

lengths achieved because of the recommended signal phasing will allow for concurrent movements and pedestrian phases to be served simultaneously which will also dissuade pedestrians and bicycles from disregarding traffic signal indications. The analysis period showed one pedestrian/vehicle head on collision due to pedestrian non-adherence of traffic signal indication and one vehicle/bicycle broadside collision at the intersection of Huntwood Avenue/Industrial Parkway.

Other Safety Considerations

A major safety concern experienced within the project study area is the presence of Union Pacific railroad tracks across Huntwood Avenue, south of the intersection of Huntwood Avenue/Sandoval Way. The railroad tracks are located approximately 185 feet from the study intersection and do not have gates or traffic/preemption signal to clear existing traffic on the railroad tracks. This creates a hazardous situation for vehicles travelling northbound on Huntwood Avenue especially during the p.m. peak period where northbound direction is the peak direction of traffic with approximately 1,150 vehicles per hour. Under existing conditions, northbound traffic queues spillover past the railroad tracks due to the limited vehicle throughput through both study intersections.

Additionally, the proposed lane configuration provided by the City reduces the number of through lanes in the southbound direction from two through lanes to one to provide Class II bike lanes along Huntwood Avenue. The lane reduction with existing signal phasing is expected to impact westbound left-turn movement at the intersection of Huntwood Avenue/Industrial Parkway during the a.m. peak period resulting in spillover of westbound left-turning vehicles into the through lanes. The lane reduction is expected to result in significant traffic queueing for the eastbound right-turning vehicles during the p.m. peak period.

Alternative 2 recommended signal phasing will allow for concurrent northbound and southbound through vehicles to be served simultaneously at both study intersections allowing for higher vehicle throughput and queue clearance.

Conclusion

Based on the analysis conducted, Alternative 2 lane configuration and signal phasing improvements at the intersections of Huntwood Avenue/Industrial Parkway and Huntwood Avenue/Sandoval Way would help facilitate reduction in delay, and traffic queues at the study intersections, especially spillover of traffic queues on the railroad tracks. However, implementation of Alternative 2 signal phasing will require considerable signal modifications at both study intersections.

The intersection of Huntwood Avenue/Industrial Parkway will require replacing existing split phase shared signal faces for the north and south approaches to protected left-turn signal face and through movement signal faces. Existing detection system will need to be upgraded. AMG recommends installing video detection at this intersection since video detection provides better detection for bicycles. This would improve the bicycle detection for the new Class II and Class IV bike lanes that are proposed with the Huntwood Avenue Road Diet project. Installing longer mast arm to support protected left-turn phasing and through movement signal heads and signage may be needed.

The intersection of Huntwood Avenue/Sandoval Way will require replacing existing split phase shared signal faces for all approaches to protected left-turn signal face and through movement signal faces for the north and south approaches along Huntwood Avenue and permissive signal phasing signal heads for

the east and west approaches. Video detection is recommended at this intersection to provide bicycle detection for the Class II and Class IV bike lanes installed as a part of the Huntwood Avenue Road Diet project. Additional mast arm to support proposed signal phasing signal heads and signage may be needed.

It is also recommended to install queue clearance detectors and peer to peer communication, north of the railroad tracks to ensure that traffic queues do not spillover onto the railroad tracks.

AMG recommends implementing Alternative 1 improvements as an interim measure and Alternative 2 once funding is available for signal upgrades. Additionally, it is recommended to monitor the intersections on a pre-determined basis (monthly/quarterly) to observe traffic conditions.

If you should have any questions or need additional information, please feel free to contact me at (415) 688-0024 or via e-mail at joy@amobility.com.

Best Regards,

Joy Bhattacharya

Vice President, Director of Innovative Transportation Solutions (AMG)
