

How Does Recycling Help the Environment?

Recycling helps the environment by reusing things again and by recycling we save energy. We can stop Global cooling and Warming just by recycling. If we don't recycle animals and plants will become extinct. So will humans because without oxygen we will also die out. The only way we can stop animals and plants from being extinct is by using the 3r's reduce, reuse, and recycle. The way that I help is by recycling and reusing and that is what everyone should do otherwise the world should recycle and that's how recycling helps the environment.
